

FUNGICIDE

# CAPTAN GOLD® XL

Captan Gold XL is the latest formulation from ADAMA for captan and is still the versatile, broad-spectrum fungicide you know and trust.

## The Confidence, Quality & Performance You'd Expect

Only Captan Gold XL delivers a superior mixing and handling experience while being backed by over 50+ years of dedicated captan manufacturing expertise. As a non-systemic contact fungicide that acts immediately to penetrate fungal spores, Captan Gold XL protects high-value crops against the toughest diseases. It has a multi-site mode of action which is ideal in the fight against fungicide resistance.

## A Uniquely Different Captan

- Higher caliber mixing and handling experience
- Low foam formulation does not require defoaming agent
- Little to no sediment residue eliminates clogging issues

## The Trusted Broad-spectrum Fungicide Partner

Backed by more than 50 years of captan manufacturing experience, Captan Gold XL delivers excellent efficacy through its multi-site mode of action, making it the go-to trusted partner in fungicide resistance management. This highly versatile formulation works well under a wide range of growing conditions, climates and soil types.

Captan Gold XL provides growers with uncompromising performance as it penetrates fungal spores, protecting high-value crops against tough diseases like scab, leaf spot, blight, botrytis (gray mold) and brown rot.

## Active Ingredient

Captan

## Formulation

Water-dispersable Granule

## Target Crops

Pome, Berries, Grapes, Stone Fruits, Tree Nuts

## Mode of Action

Multi-Site Contact

## Group Number

M4

## Signal Word

Danger

## Restricted Use

No

### Quick Tips

- Broad-spectrum, non-systemic contact fungicide that acts immediately to penetrate fungal spores.
- Acts primarily as a protectant that offers a different mode of action, which is ideal for fungicide management.
- Multi-site contact activity attacking fungal protein-containing thiols (-SH groups), interfering with several chemical processes, interrupting metabolism and cell division ultimately preventing spore from germinating.
